1.0 Introduction

1.1 Purpose of Document

This document will outline the business requirements for automating a series of steps for six different county websites in the Claim Center application.

The specific steps involved may vary for each website, but the overall objective is to streamline and automate the process of accessing data and retrieving Case information from these websites and then triggering the Guidewire API with the retrieved Case No and Case Style for storage.

1.2 Background

United Auto Insurance Company (UAIC) is engaged in managing insurance claims where legal proceedings may be involved. Currently, claim handlers manually review legal dockets across multiple county court websites to identify if a case exists for insured individuals. This process involves cross-checking multiple case details and, if a match is found, updating the Claim Center via the Guidewire API.

This manual approach is time-consuming, prone to human error, and lacks scalability. To streamline this workflow, UAIC is initiating an automation project to reduce effort, improve accuracy, and ensure timely case identification.

The goal of this project is to develop and deploy a **Robotic Process Automation (RPA)** bot that automatically reads case information from an Excel file shared weekly, searches across six designated county court websites, verifies potential matches, and, when confirmed, triggers the Guidewire API to log the relevant case information.

By automating this routine, repetitive task, UAIC aims to improve efficiency, reduce operational risk, and allow claims staff to focus on higher-value activities.

2.0 Project Scope

2.1 Business Requirements

The objective is to automate the process of accessing and retrieving case information from six different court websites and then triggering the Guidewire API to create activity to Claim Center application.

The specific steps involved may vary for each website, but the overall objective is to streamline and automate the process of accessing and retrieving case information from these websites and then triggering the Guidewire API with the retrieved Case No and Case Type to create Activity to Claim Center application.

- Following county/court website are in scope:

County Name	URLs
Florida	
• Miami Dade	Civil, Family and Probate Courts Online System
• Broward	Case Search - Public - Broward County Clerk of Courts
• Hillsborough	Hover Home

Texas	
• Dallas	Dallas County Online Record Search
• Travis	Civil - Travis County Clerk
• Harris	Web Inquiry

2.2 Proposed Solution

Process Overview:

1. Schedule Trigger

- **Frequency:** Every Sunday (weekly).
- **Trigger:** Scheduled RPA Bot execution.

2. Input Data Source

- **Source:** Excel (CSV) file shared by UAIC.
- **Fields Extracted from Each Record:**
 - Claim Number
 - Exposure Number
 - Insured First Name
 - Insured Last Name
 - Driver First Name
 - Driver Last Name
 - DOL (Date of Loss)
 - Plaintiff/Claimant (Other party): **Usually comes first in the case style**

3. Case Search Logic

- **Search Criteria:**
 - The bot uses a combination of **First Name**, **Last Name**, and **Date of Loss** to perform a search across **six county websites**.
 - If the insured and driver's name is the same, do only one search.
 - If both names are different, do a dual search for both the names.
- **Execution:**
 - For each case record, the bot attempts to search on each of the six websites until a case is found, or all options are exhausted.

4. Case Handling Logic

- **If Case is Found:**
 - Extract the following from the county website:
 - **Case Number**
 - **Case Style**
 - **Website name**
 - **Date filed**
 - **Verification:**
 - Check if the **Case Style** matches the **Plaintiff** name from the Excel file.
 - **If Verified (Positive Match):**
 - Trigger the **Guidewire API**.
 - Send the
 - **Case Number (from website)**
 - **Case Style (from website)**
 - **Date suit filed (from website)**
 - **Claim Number (from CSV)**
 - **County (from website)**
 - **Exposure number (from CSV)**
- to create an activity in the Claim Center.
- **If Not Verified (Mismatch):**
 - Continue the search for any other possible matching cases for the same record.
 - **If Case is Not Found:**
 - Proceed to the next case in the Excel file and repeat the search process.

2.3 In Scope

- Reading and extracting data from the Excel file shared by UAIC (First Name, Last Name, DOL, Plaintiff/Claimant).
- Performing case searches using extracted data on the following county websites:
 - Miami-Dade
 - Broward
 - Hillsborough
 - Dallas
 - Travis

- Harris
- Verifying the Case Style from the website against the Plaintiff/claimant name.
- Triggering the **Guidewire API** to send positive matches.
- Logging and proceeding to the next case if no match is found or validation fails.

2.4 Out of Scope

- Creation or development of the Guidewire API itself.
- Manual verification or intervention in the case matching process.
- Data corrections or validations in the Excel sheet provided by UAIC.
- Handling legal document downloads or court document scraping.
- Any websites beyond the 6 counties listed are not included in the current automation.

3.0 Assumptions/Constraints

- **Excel File Format is Consistent:** The structure, headers, and data types in the Excel file shared by UAIC remain unchanged.
- **Website Availability:** All 6 county court websites are available and accessible at the time the bot runs (every Sunday).
- **Search Criteria is Sufficient:** A combination of First Name, Last Name, and Date of Loss is adequate for accurately identifying case results on each website.
- **Guidewire API is Functional and Accessible:** The API endpoint is stable, accessible, and ready to receive case data when a match is found.
- **Bot Credentials and Access:** The RPA bot has necessary permissions to access the Excel file location, court websites, and the Guidewire API.
- Number of Bots would be required based on the number of records to be process.

4.0 Risks

- **Website Structure Changes:** Any change in layout, URL, or search behavior of the county websites may break the automation flow.
- **Inconsistent or Incomplete Data in Excel:** Missing or incorrectly formatted fields in the Excel file can cause errors or skipped records.
- **API Failures or Downtime:** If the Guidewire API is down or responds with errors, case data may not be sent or logged properly.
- **False Positives in Matching:** Cases with similar names or dates may result in incorrect matches if the Case Style verification is not strict enough.
- **Automation Runtime Delays:** If any site is slow or unresponsive, the bot's total run time may increase significantly or lead to timeouts.
